Nutricote Qualities

Nutricote controlled release fertilizers utilize a unique polymer resin which coats the fertilizer granule to provide a continuous slow release of nutrients throughout the crop cycle. The coating is resilient and resists cracking when used in mixing equipment. Nutricote is available in various longevities ranging from 40 days to 360 days of release based on an average soil temperature of 77°F. The products can be either incorporated or topdressed, and are available in both NPK (Nutricote) and NPK + minors (Nutricote Total) formulations.

NPK Controlled Release Fertilizer- No Minor Nutrients

Nutricote Controlled Release Fertilizer contains NPK in a controlled release prill. Resin coating provides safe and predictable nutrient release over a wide range of conditions. Day lengths are calculated on an average soil temperature of 77°F.
